

Troubleshooting & Debugging Report

Student: Jhony Herrera

Assignment: Single A - Lab 3

Objective: Identify errors across multiple scripts and debug errors for operation

Overview

This task involved debugging JavaScript, Python, and HTML code, each presenting different types of errors. Visual Studio Code (VS Code) was used as the primary troubleshooting tool, allowing error messages and warnings to be easily identified. By carefully analyzing these messages and observing how the code behaved during execution, the underlying issues were located and corrected. This process reinforced the importance of reading error output closely, testing changes incrementally, and understanding how small logic mistakes can impact overall program behavior.

Tools

Visual Studio Code

Browser Developer Tool

Open Server

Prettier Extension

Python_app4.py

Line 85: add colon after "else"

Line 31: replace "0" with "len(numbers)" to match line 26

Line 92: removed "+" to fix logic error

Script4.js

Line 109: add "}" before "else"

Line 123: error automatically corrected after line 109 edit

Line 26: added a "-" before "Infinity"

Line 27: removed "-" from "-Infinity"

Line 58: added a third "=" for strict equality

Line 67: changed code to define PrintSummary

Line 94: Changed "k < 0" to "k >= 0" and added "-1" to "players.length"

Line 102: remove "++"

Index4.html

Line 91: add "}" before "else"

Line 118: error automatically corrected after line 91 edit

Line 32: removed "=" to correct undefined logic error

Line 42: corrected logic error, changed min to max
Line 43: corrected logic error, changed max to min
Line 82: swap min & max
